

Study Alpha Protocol v3.2

Sakura Clinical | Controlled synthetic training record | 2026-09-02

Field	Specification	Owner	Status
Version	v3.2 / 2026-09-02	Protocol governance	Current
Cohort	48 (24 / 24)	Study operations	Synthetic
Review threshold	2.5 mg	Protocol review	Non-clinical

Purpose and scope

This wholly synthetic internal document supports the Sakura Clinical Study Alpha 2026 snapshot dated 2026-09-02. The cohort is 48 participants: 24 assigned to SC-A 2.5 mg and 24 matched controls. It is not clinical advice and contains no personal or patient information. The protocol review threshold of 2.5 mg is an operational review criterion only, not a treatment recommendation.

Design

Parallel, matched-control, synthetic study workflow with Day 0 baseline and Day 28 review. Allocation outputs are stored only as aggregate synthetic data.

Endpoints

Primary analytic outcome: Day-28 mean change. Snapshot result: -4.8 for SC-A 2.5 mg versus -2.1 for matched control; adjusted difference -2.7 (95% CI -4.1 to -1.3).

Safety oversight

Seven non-serious synthetic adverse events across six participants were recorded; zero synthetic serious adverse events. Events are reviewed through the adjudication charter and deviation workflow.

Governance

Version changes require documented review, accountable owner sign-off, and inclusion in the trial master file index.
