

Results methods note

Study Alpha 2026 | synthetic analysis convention

Analysis population

All 48 randomized synthetic cases were included in the analysis population, with 24 cases per treatment arm.

Endpoint convention

The Day-28 change is reported as Day-28 score minus baseline score. Arm means are -4.8 for SC-A 2.5 mg and -2.1 for Matched control.

Safety convention

Events are listed per occurrence: seven non-serious events across six SC-A 2.5 mg participants and zero serious adverse events.

Review limitation

The 2.5 mg value is a protocol review threshold, not medical advice.
