

Study Beta results interpretation

Sakura Clinical Study Beta 2026 | Synthetic exploratory feasibility cohort | n=36 (18/18)

Purpose

This review summarizes synthetic descriptive outputs for an exploratory feasibility cohort. It is not confirmatory efficacy evidence and must not guide clinical care or dosing.

Measure	Intervention	Comparator	Descriptive comparison
Week 8 feasibility score change	7.4	6.8	Difference 0.6; 95% CI -0.8 to 2.0; exploratory p=0.39
Completion	18/18	18/18	36/36 records completed Week 8
Threshold review	0 flags	0 flags	2.5 mg review threshold; synthetic operational context

Interpretation

The small, imprecise synthetic difference is compatible with multiple plausible directions. Full visit completion supports the feasibility scenario represented here, but it does not establish clinical benefit, safety, or generalizability. No serious events appear in the synthetic listing.

Limitations

The dataset is constructed for corpus production and contains no participants, sites, or real measurements. The 2.5 mg threshold is a document-review anchor only and is not dosing guidance. No formal decision rule is evaluated.

Fully synthetic training artifact. Exploratory and non-confirmatory. Not medical advice. Data snapshot: 2026-09-02.
