

Statistical review memorandum

Sakura Clinical Study Beta 2026 | Synthetic descriptive analysis | Snapshot 2026-09-02

Analysis population

The full analysis and safety populations each contain 36 synthetic records: 18 Intervention and 18 Comparator. All 36 records have Baseline, Week 4, and Week 8 completion.

Check	Result	Assessment
Arm reconciliation	18 + 18 = 36	Pass
Endpoint means	7.4 versus 6.8	Descriptive only
Contrast estimate	0.6 (95% CI -0.8 to 2.0)	Imprecise; not confirmatory
Exploratory p-value	0.39	No confirmatory inference
Review threshold	2.5 mg; 0 synthetic flags	Operational label only

Methods note

The synthetic endpoint table uses arm-level descriptive means and an illustrative uncertainty interval. No multiplicity adjustment, estimand claim, or treatment recommendation is made. The safety listing is limited to five mild, resolved synthetic records and reports no serious events.

Reviewer conclusion

Counts and stated outputs reconcile across the supplied synthetic result artifacts. Retain the non-confirmatory label in downstream presentations and do not interpret the threshold or descriptive difference as medical guidance.

Fully synthetic training artifact. Exploratory and non-confirmatory. Not medical advice. Data snapshot: 2026-09-02.
