

Data Review Charter

Sakura Clinical Study Alpha 2026 | Internal synthetic planning artifact | Review date: 2026-09-02

Purpose

Provide a shared, auditable review frame for aggregate synthetic Study Alpha information. This charter supports discussion; it does not establish clinical guidance or a participant-level decision.

Anchor	Agreed review frame
Study	Sakura Clinical Study Alpha 2026
Population	Synthetic cohort of 48; aggregate reporting only
Threshold	2.5 mg review threshold
Scope	Parent endpoint and safety review spine
Boundary	No real PHI, identities, sites, or individual narratives

Review questions

- Is the synthetic cohort accounting complete at n=48?
- Are parent endpoint summaries version-controlled and internally consistent?
- Does any aggregate observation meet or exceed the 2.5 mg review threshold?
- Are safety reconciliations and decision records ready for the shared readout?

Roles and escalation

Function	Responsibility	Escalate when
Clinical research	Chair review; confirm threshold interpretation	A threshold-related observation needs shared disposition
Data management	Confirm cohort accounting and source traceability	Aggregate counts are inconsistent or incomplete
Safety	Reconcile synthetic safety signals	A discrepancy remains unresolved
Biostatistics	Confirm endpoint summary version and QC	A summary cannot be reproduced from agreed inputs
Regulatory operations	Record decision-ready artifacts	Readout package lacks required internal review material

Outputs and controls

The review produces an action tracker, threshold review log, safety reconciliation, endpoint QC note, and team readout. Each item uses only synthetic, aggregate content. Any unresolved high-priority item is explicitly carried into the next review record.

Prepared for shared team discussion. All data and examples are synthetic.
