

Sakura Clinical - Study Alpha 2026

Quick reference | 2026-09-02 | Synthetic clinical VDI working copy

Anchor	Working reference
Cohort	48 synthetic records
Protocol review threshold	2.5 mg
Endpoint spine	Internal endpoint review on track
Safety spine	Three synthetic follow-ups require owner confirmation
Use boundary	Aggregate training material only; no PHI or real system data

Before the review

1. Confirm the snapshot date and synthetic cohort count. 2. Use 2.5 mg as the stated protocol review threshold. 3. Open the query board and ensure each open safety follow-up has one accountable role.

During the review

Keep endpoint and safety discussions separate: endpoint readiness is an aggregate status; safety follow-ups are a controlled work queue. Escalate inconsistencies as a review note, not as a clinical finding.

Handoff language

“Study Alpha 2026, snapshot 2026-09-02: 48 synthetic records reviewed against the 2.5 mg threshold. Endpoint materials are on track; three synthetic safety follow-ups remain assigned for next check.”

SYNTHETIC TRAINING ENVIRONMENT - This file has no real participant, clinician, site, credential, or clinical-system information.
