

Synthetic Literature Review: Study Alpha

Internal evidence orientation | Sakura Clinical | 2026-09-02 | version 0.3

Scope note

All studies, sources, authors, and evidence in this document are fictional synthetic training material. Not medical advice. Review anchor: cohort 48; protocol review threshold: 2.5 mg.

Review question

How should fictional internal sources be organized before the Study Alpha protocol review at the 2.5 mg threshold? This synthesis separates descriptive signals from decision-grade evidence and preserves the cohort 48 anchor.

Method

- Screened four invented internal source packets drafted for training.
- Captured study design, population framing, threshold linkage, and interpretive limits.
- Did not use real articles, real journals, external databases, or patient-level information.

Synthesis

Across the invented source set, observations are directionally consistent enough to justify a structured protocol discussion, but not to support a clinical recommendation. The review group should treat the 2.5 mg line as an administrative review boundary, confirm data lock status, and document unresolved uncertainty.

Synthetic evidence register

Source	Design	Population	Finding	Use in review
Alpha-A (synthetic)	Parallel comparison	Cohort 48	Directional endpoint pattern; uncertainty remains	Context only
Alpha-B (synthetic)	Open-label sequence	Cohort 48	Exposure pattern reviewed through 2.5 mg	Threshold discussion
Alpha-C (synthetic)	Crossover note	Completers subset	Inconclusive exploratory signal	Sensitivity check
Alpha-D (synthetic)	Retrospective summary	Aggregate records	Confounding limits interpretation	Not decision-grade

Decision boundary: this file supports an internal fictional protocol review only. It does not establish care, dosing, diagnosis, or safety guidance.
