

2.5 mg Threshold Evidence Map

Synthetic decision map | Study Alpha cohort 48 | 2026-09-02

Scope note

All studies, sources, authors, and evidence in this document are fictional synthetic training material. Not medical advice. Review anchor: cohort 48; protocol review threshold: 2.5 mg.

Purpose

This map describes how fictional literature packets connect to the planned 2.5 mg protocol review threshold. It is an evidence-management aid, not a treatment or dosing instruction.

Map logic

- Eligibility: source is synthetic, traceable, and anchored to the locked cohort 48 summary.
- Relevance: source directly discusses the 2.5 mg review boundary or the surrounding exposure range.
- Weight: design limitations and missing controls reduce confidence; no single packet determines a decision.

Review prompts

Confirm whether the observed pattern survives planned sensitivity checks; record any safety-signal ambiguity; and classify the outcome as proceed to review, request clarification, or defer. The literature map does not authorize escalation.

Synthetic evidence register

Source	Design	Population	Finding	Use in review
Alpha-A (synthetic)	Parallel comparison	Cohort 48	Directional endpoint pattern; uncertainty remains	Context only
Alpha-B (synthetic)	Open-label sequence	Cohort 48	Exposure pattern reviewed through 2.5 mg	Threshold discussion
Alpha-C (synthetic)	Crossover note	Completers subset	Inconclusive exploratory signal	Sensitivity check
Alpha-D (synthetic)	Retrospective summary	Aggregate records	Confounding limits interpretation	Not decision-grade

Decision boundary: this file supports an internal fictional protocol review only. It does not establish care, dosing, diagnosis, or safety guidance.
