

Cohort 48: Design and Methods Note

Fictional methods companion | Sakura Clinical Study Alpha 2026 | 2026-09-02

Scope note

All studies, sources, authors, and evidence in this document are fictional synthetic training material. Not medical advice. Review anchor: cohort 48; protocol review threshold: 2.5 mg.

Design frame

The fictional source package uses a cohort 48 review set as the common analytical anchor. Source descriptions intentionally vary in design so the review can distinguish corroboration from replication.

Methods safeguards

- Use aggregate, invented observations only; no patient records or real-world case details appear in this file.
- Keep descriptive endpoint patterns separate from causal claims.
- Treat the 2.5 mg protocol threshold as a review trigger and record pre-specified questions before interpreting the synthetic summaries.

Limitations

The source packets are created for corpus realism and document-handling practice. They do not provide generalizable clinical evidence, and the labels Alpha-A through Alpha-D are fictional internal references.

Synthetic evidence register

Source	Design	Population	Finding	Use in review
Alpha-A (synthetic)	Parallel comparison	Cohort 48	Directional endpoint pattern; uncertainty remains	Context only
Alpha-B (synthetic)	Open-label sequence	Cohort 48	Exposure pattern reviewed through 2.5 mg	Threshold discussion
Alpha-C (synthetic)	Crossover note	Completers subset	Inconclusive exploratory signal	Sensitivity check
Alpha-D (synthetic)	Retrospective summary	Aggregate records	Confounding limits interpretation	Not decision-grade

Decision boundary: this file supports an internal fictional protocol review only. It does not establish care, dosing, diagnosis, or safety guidance.
