

Synthetic Endpoint Review

Endpoint framing memo | Study Alpha cohort 48 | 2026-09-02

Scope note

All studies, sources, authors, and evidence in this document are fictional synthetic training material. Not medical advice. Review anchor: cohort 48; protocol review threshold: 2.5 mg.

Question

What endpoint patterns are described in the fictional literature packet, and what wording remains appropriate before a protocol review?

Observed patterns

- Alpha-A reports a directional primary endpoint pattern in an invented parallel comparison.
- Alpha-B describes an exposure-associated trend through the review boundary.
- Alpha-C contains an inconclusive exploratory comparison.
- Alpha-D becomes weaker after hypothetical confounding adjustment.

Interpretation

The materials support disciplined documentation of patterns, not proof of benefit. Any protocol discussion should foreground uncertainty, completeness checks, and the distinction between an internal threshold review and medical advice.

Synthetic evidence register

Source	Design	Population	Finding	Use in review
Alpha-A (synthetic)	Parallel comparison	Cohort 48	Directional endpoint pattern; uncertainty remains	Context only
Alpha-B (synthetic)	Open-label sequence	Cohort 48	Exposure pattern reviewed through 2.5 mg	Threshold discussion
Alpha-C (synthetic)	Crossover note	Completers subset	Inconclusive exploratory signal	Sensitivity check
Alpha-D (synthetic)	Retrospective summary	Aggregate records	Confounding limits interpretation	Not decision-grade

Decision boundary: this file supports an internal fictional protocol review only. It does not establish care, dosing, diagnosis, or safety guidance.
