

Synthetic Safety Signal Review

Safety-signal orientation memo | Study Alpha cohort 48 | 2026-09-02

Scope note

All studies, sources, authors, and evidence in this document are fictional synthetic training material. Not medical advice. Review anchor: cohort 48; protocol review threshold: 2.5 mg.

Safety framing

This fictional review catalogues signal-handling language for a training corpus. It does not report real adverse events, patients, products, or clinical outcomes.

Signal-handling approach

- Capture each invented observation as a descriptive signal, not a causal attribution.
- Check completeness, timing, and internal consistency before discussing the 2.5 mg review threshold.
- Escalate only within the fictional protocol-governance workflow represented by these documents.

Conclusion

The synthetic source set contains no decision-grade safety conclusion. A documented review of cohort 48 information is appropriate; any real clinical question requires qualified medical and regulatory processes outside this corpus.

Synthetic evidence register

Source	Design	Population	Finding	Use in review
Alpha-A (synthetic)	Parallel comparison	Cohort 48	Directional endpoint pattern; uncertainty remains	Context only
Alpha-B (synthetic)	Open-label sequence	Cohort 48	Exposure pattern reviewed through 2.5 mg	Threshold discussion
Alpha-C (synthetic)	Crossover note	Completers subset	Inconclusive exploratory signal	Sensitivity check
Alpha-D (synthetic)	Retrospective summary	Aggregate records	Confounding limits interpretation	Not decision-grade

Decision boundary: this file supports an internal fictional protocol review only. It does not establish care, dosing, diagnosis, or safety guidance.
