

Vendor spend export guide

Data-handling readme | Summit Vale Advisory | 13 Jul 2026

Purpose

Purpose

This guide sets a consistent intake pattern for supplier-spend extracts used in portfolio coordination. It applies to synthetic working exports only and does not authorize access to vendor systems or transmission of supplier account information.

Minimum intake standard

Each file needs a stable download ID, client code, received timestamp, source description, owner, and validation status. If any is unavailable, mark the item Held and add an open request.

Required register fields

Field	Required format	Example
download_id	Stable synthetic identifier	DL-260713-001
client_code	CA or CB	CA
received_at	ISO 8601 timestamp	2026-07-13T08:35:00+09:00
file_status	Received / validated / held	Validated
retention_note	Plain-language handling note	Working export; review weekly

Safe handling

Use aggregated spend categories and approved planning amounts. Exclude bank accounts, tax identifiers, invoices, personal contact information, and contractual attachments.

Validation and release rules

Validation sequence

Confirm delimiter and encoding; compare row count to the source note; check that each client code is valid; verify dates and owner values; and record a concise exception note when the file is held.

Classification rules

Received means logged but not yet checked. Validated means the metadata and structural checks are complete. Held means it needs correction or approval before use. Superseded means a newer timestamped export exists.

Release discipline

Release only the current validated working export to the meeting package. Retain the download register as the trace of what was received and when; do not overwrite historical rows.
