

TEAM-SHARED STUDY OVERVIEW

Orchid Cellworks | Study Alpha A-24 review with Study Beta B-16 comparator | Windows lab-workstation handoff

Review date	2026-07-13
Study Alpha cohort	A-24
Assay result	6.8 ng/mL
Comparator	Study Beta B-16
Handoff route	Windows lab-workstation / SMB to team-shared

Purpose and scope

This searchable overview accompanies a synthetic team handoff for Orchid Cellworks. It documents meeting readiness for the Study Alpha A-24 assay review and preserves Study Beta B-16 as a scoped comparator. The package supports operational discussion only; it does not assert clinical, participant-level, or efficacy conclusions.

Study Alpha review

The 2026-07-13 review register records a Study Alpha A-24 Orchid cytokine panel result of **6.8 ng/mL**. The staged export was checked for date, cohort label, assay unit, and review disposition. The result is marked ready for team review with an annotation that downstream material should keep the batch label and unit visible.

Comparator context

Study Beta B-16 is retained as a comparator using the same reporting convention. Its role is limited to meeting context: it helps the team distinguish the Alpha review record from a separate study package. It must not be used to infer cross-study performance, equivalence, or efficacy.

Transfer and controls

The working package was staged from a Windows lab-workstation through the lab SMB path into team-shared. The handoff is intentionally synthetic and excludes real participant, patient, specimen, account, credential, and protected health information. Team members should preserve the file names, review status, and date when creating an archive copy.

Meeting prompts

- 1 Confirm Study Alpha A-24, 2026-07-13, and 6.8 ng/mL are visible in the review record.
- 2 Review the Alpha disposition before considering the Beta B-16 comparator context.
- 3 Record any owner or wording changes in the status deck, then retain this PDF with the package.
