

Synthetic Cohort Coding Guide

Orchid Cellworks | Dataset labeling rules | 2026-07-13

Scope

Use this guide when creating or reviewing synthetic dataset labels for Alpha A-24 and Beta B-16. These codes describe fictional training cohorts only. They must never be used to represent a real person, specimen, patient, or external source.

Coding pattern

Segment	Allowed values	Meaning
Program	ALPHA or BETA	Synthetic study family
Cohort	A24 or B16	Synthetic cohort grouping
Run date	20260713	Local lab run date
Assay lane	R1, R2, or QC	Synthetic processing lane
Record type	OBS, REF, or NOTE	Observation, reference, or annotation

Example labels

Label	Use
ALPHA-A24-20260713-R1-OBS	Synthetic Alpha observation record
ALPHA-A24-20260713-QC-REF	Alpha reference check
BETA-B16-20260713-R2-OBS	Synthetic Beta observation record
BETA-B16-20260713-R1-NOTE	Non-numeric internal note

A code is an operational label, not an identity. Never add names, accession numbers, contact details, or credentials.

Validation rules

Readability, consistency, and synthetic-data boundaries

Required checks

Check	Pass condition	Action if absent
Program/cohort pairing	ALPHA pairs with A24; BETA pairs with B16.	Stop entry and correct the label.
Date token	Eight digits and matches 20260713 for this reference set.	Confirm source run sheet.
Lane token	R1, R2, or QC only.	Use NOTE only for narrative record type, not as a lane.
Unit record	Concentration is stored separately from the code.	Do not append unit text to the code.
Synthetic boundary	No real-person or specimen identifier appears.	Remove the identifier and escalate.

Export-friendly fields

Store the code, cohort, run_date, assay_lane, record_type, concentration_value, concentration_unit, dilution_factor, and review_status in separate fields. This structure permits useful filtering without making the code itself carry sensitive or ambiguous information.

Document status: fictional training reference for Orchid Cellworks. All labels and examples are synthetic.
