Fictional synthetic dataset - prepared 2026-07-13

Figure 1. Study Alpha A-24 assay response.

Synthetic assay response values for cohort A-24 (OCW-A24-001 through OCW-A24-024). The horizontal reference indicates the synthetic cohort median of 6.8 ng/mL. This figure is illustrative only and contains no real research data.

Figure 2. Replicate distribution and precision.

Paired synthetic duplicate measurements are summarized for 24 fictional samples. The displayed operating criterion is duplicate CV $\leq$ 10%. Violin envelopes show illustrative measurement distributions.

Figure 3. QC control chart.

A synthetic Levey-Jennings-style control chart for run ALPHA-A24-R03. The target is 6.8 ng/mL and the shaded recovery region is 90-110% (6.12-7.48 ng/mL). All depicted observations are synthetic.

Figure 4. Alpha and Beta assay comparison.

Study Alpha cohort A-24 is shown beside the synthetic Study Beta B-16 comparator. The comparator baseline is 1.00 and treated value is 1.18. Values use different display scales and are not intended for clinical interpretation.

Figure 5. Assay workflow manuscript panel.

A conceptual depiction of protocol OCW-BIO-017: cohort intake, duplicate preparation, controlled incubation, analytical readout, and QC review. The quality gate uses fictional acceptance rules of CV $\leq$ 10% and recovery 90-110%.

Figure 6. Study Alpha cohort schematic.

A synthetic cohort flow diagram showing 24 fictional identifiers, OCW-A24-001 through OCW-A24-024, moving from enrollment set through duplicate assay to analyzed cohort. No individuals or personal data are represented.

Data statement

All figures and identifiers in this document are fictional and were created solely for this corpus. They are not clinical records, do not describe participants, and do not report actual experimental results.
