

# Cross-study QC note

Orchid Cellworks · wholly synthetic method-training record · 2026-07-13

This note compares the separate synthetic Study Alpha and Study Beta workflows while preserving their non-equivalence.

| Comparison area        | Alpha / Beta                    | QC interpretation                                            |
|------------------------|---------------------------------|--------------------------------------------------------------|
| Study Alpha            | cohort A-24; ALPHA-A24-R03      | assay concentration 6.8 ng/mL                                |
| Study Beta             | cohort B-16; BETA-B16-R02       | normalized baseline 1.00; treated 1.18                       |
| Shared control idea    | calibration review              | training consistency only                                    |
| Non-equivalence caveat | different cohorts and endpoints | do not convert Alpha concentration to Beta normalized signal |

All listed observations and values are synthetic; no external specimens, participants, or patient data were used.
