

Alpha / Beta Synthetic Context Note

Orchid Cellworks | 2026-07-13 | wholly synthetic internal analysis

Purpose and scope

This note distinguishes a contextual Alpha reference from the primary Study Beta B-16 analysis. It is not an equivalence, efficacy, or clinical comparison.

Dimension	Study Alpha context	Study Beta primary
Cohort	cohort A-24	cohort B-16
Anchor	assay 6.8 ng/mL	normalized response
Role	Communication reference	Method-review evidence

Non-equivalence boundary

Different wholly synthetic cohorts, synthetic exports, and analytical objectives prohibit direct inference. The Alpha anchor exists only so readers can locate the shared corpus narrative.

Beta readout

Beta baseline is 1.00; treated planning target is 1.18; observed synthetic mean is 1.136. Duplicate CV is 6.2%.

Review actions

Keep labels explicit, avoid pooled statistics, and preserve the primary/secondary distinction in downstream documentation.

Boundary: all Study Alpha/Beta records, samples, values, and identifiers are fictional. This artifact contains no PHI, PII, secrets, credentials, or real research data.
