

CAPA effectiveness reference

Decision guide for sustained corrective-action verification

ForgeLine | Product Alpha | 2026-08-11 | NCR-026 | tolerance +/- 0.18 mm

Purpose

This guide defines a consistent synthetic method for deciding whether a corrective action remains effective after implementation. It is scoped to ForgeLine Product Alpha and uses NCR-026 as the teaching case.

Effectiveness requires more than a closed action list. Evidence should show that the selected control is present, the check was performed, and the defined acceptance band was met.

Review cadence

Review at the agreed checkpoint after the action is active. Compare the measured output with the control plan, capture exceptions, and escalate unresolved risk through the quality review path.

For dimensional checks, use the stated +/- 0.18 mm band. An in-band result is evidence, not a reason to remove required trend review.

Application matrix

Evidence	Checkpoint	Decision signal	Reviewer action
Measurement sample	Post-action check	Within stated band	Record result and retain traceability
Control verification	Process walk-through	Control present and used	Confirm owner and revision
NCR linkage	NCR-026 review	No recurring mechanism	Document effectiveness rationale

Use note: This is a synthetic internal reference. It does not represent a supplier, certification, product, or quality record.
