

FMEA rating reference

Severity, occurrence, and detection calibration for consistent reviews

ForgeLine | Product Alpha | 2026-08-11 | NCR-026 | tolerance +/- 0.18 mm

Rating intent

Use ratings to focus a cross-functional conversation on risk, not to create a false precision. Apply the same criteria to Product Alpha and Product Beta when the evidence and control maturity are comparable.

A rating change should cite an observed control improvement, verification evidence, or a defined change in exposure.

Dimensional example

For the ForgeLine training example, a dimensional deviation beyond +/- 0.18 mm can affect downstream fit. NCR-026 is used to illustrate containment, root-cause review, and verification linkage.

Application matrix

Dimension	Low signal	Moderate signal	High signal
Severity	No meaningful function impact	Rework or controlled hold	Potential customer-facing function loss
Occurrence	Stable control evidence	Intermittent variation	Repeat mechanism not controlled
Detection	Automated or verified detection	Sampling detection	Failure may escape current controls

Use note: This is a synthetic internal reference. It does not represent a supplier, certification, product, or quality record.
