

Quality engineering reference guide

A compact synthetic guide to controls, evidence, and escalation

ForgeLine | Product Alpha | 2026-08-11 | NCR-026 | tolerance +/- 0.18 mm

Operating model

ForgeLine quality engineering connects product risk analysis, inspection evidence, nonconformance control, and corrective-action verification. This reference is designed for Product Alpha learning material dated 2026-08-11.

A clear record answers four questions: what was expected, what was observed, which control applied, and who reviewed the decision.

Escalation logic

When an observed dimensional result is outside +/- 0.18 mm, preserve the evidence, apply defined containment, and relate the review to NCR-026 where appropriate. Do not revise a measurement to fit an acceptance band.

Use FMEA updates to make changed risk controls visible. Use CAPA effectiveness checks to show whether the action continues to prevent recurrence.

Application matrix

Reference area	Primary question	Evidence type	Connection
FMEA	What can fail and how is it controlled?	Risk review and action status	Change-order evaluation
Inspection	Did the feature meet the stated band?	Measured observation and method	NCR-026 containment
CAPA	Did the correction remain effective?	Checkpoint review and rationale	Control-plan confirmation

Use note: This is a synthetic internal reference. It does not represent a supplier, certification, product, or quality record.
