

Methods Note: Model Alpha M-14

Reproducible sequence for the synthetic-only R184 study.

frozen protocol | five labels | threshold 0.68

Scope

The method normalizes synthetic traces before encoding evidence order, then calibrates a label score for assignment or review. Each stage has a recorded input and fixed handoff.

Interpretation

Only the declared seed changes between reruns; corpus version, label map, aggregation, and routing policy remain fixed.

Decision evidence

stage	input	control
normalize	synthetic trace	field order
encode	sequence	feature map
calibrate	raw score	equal bins
route	score	0.68 policy

Pipeline and control gates

Topic-specific analytical figure for the same synthetic R184 record.

Frozen gates: v3.2 manifest → five-label map → 0.68 policy

Interpretation:

The stages show where changes are prohibited when producing a comparable rerun.
