

Error Taxonomy: run R184

Misses and confusions on held-out synthetic records.

43 reviewed errors | five-label confusion map

Scope

The review separates adjacent-label confusions from underspecified records. Verify-to-classify and escalate-to-defer are the largest directed mistakes.

Interpretation

Counts describe a bounded evaluation, not deployment rates; they point corrective work toward contrastive evidence cues.

Decision evidence

pattern	count	response
verify → classify	8	contrast cues
escalate → defer	7	manual route
classify → verify	7	boundary examples
late evidence	6	ordering refresh

Confusion matrix

Topic-specific analytical figure for the same synthetic R184 record.

		predicted intent				
		R	C	V	D	E
R		104	6	3	1	2
C		5	96	7	2	1
V		3	8	89	4	2
D		1	3	5	82	6
E		2	2	3	7	94

R/C/V/D/E = route, classify, verify, defer, escalate

Interpretation:

Directed confusions identify reviewable boundaries, rather than a generic count of mistakes.
