

Dataset Shift Study: Model Alpha M-14

Segment comparison for HF-Eval-S1/S2 v3.2.

2,400 synthetic records | S1 1,600 | S2 800

Scope

S1 and S2 retain the five synthetic intent labels but vary phrasing density and evidence order. The S2 change diagnoses sensitivity without redefining the task.

Interpretation

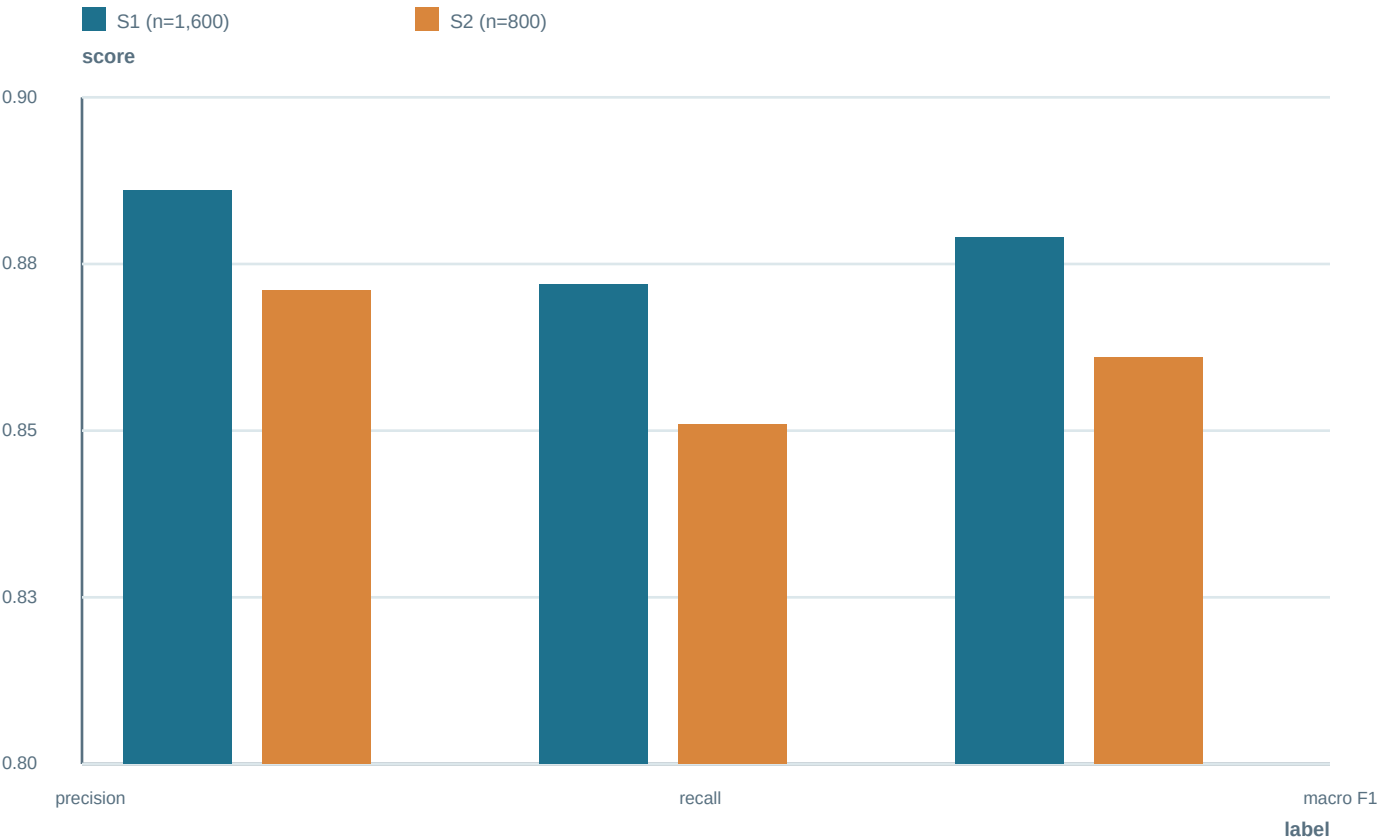

Macro F1 moves from 0.879 on S1 to 0.861 on S2; recall drives the gap and motivates delayed-evidence examples.

Decision evidence

segment	records	macro F1	change
S1	1,600	.879	reference
S2	800	.861	late evidence
combined	2,400	.873	reported card

S1 versus S2 metrics

Topic-specific analytical figure for the same synthetic R184 record.

Interpretation:

S2 exposes an evidence-order sensitivity while retaining the task definition.
