

# Comparison Study: Model Beta B-07

Controlled baseline comparison with Model Alpha M-14.

Alpha F1 0.873 | Beta B-07 F1 0.846

## Scope

Both candidates use the same five-label synthetic corpus, partitions, and evaluator. Beta falls behind most clearly in recall.

## Interpretation

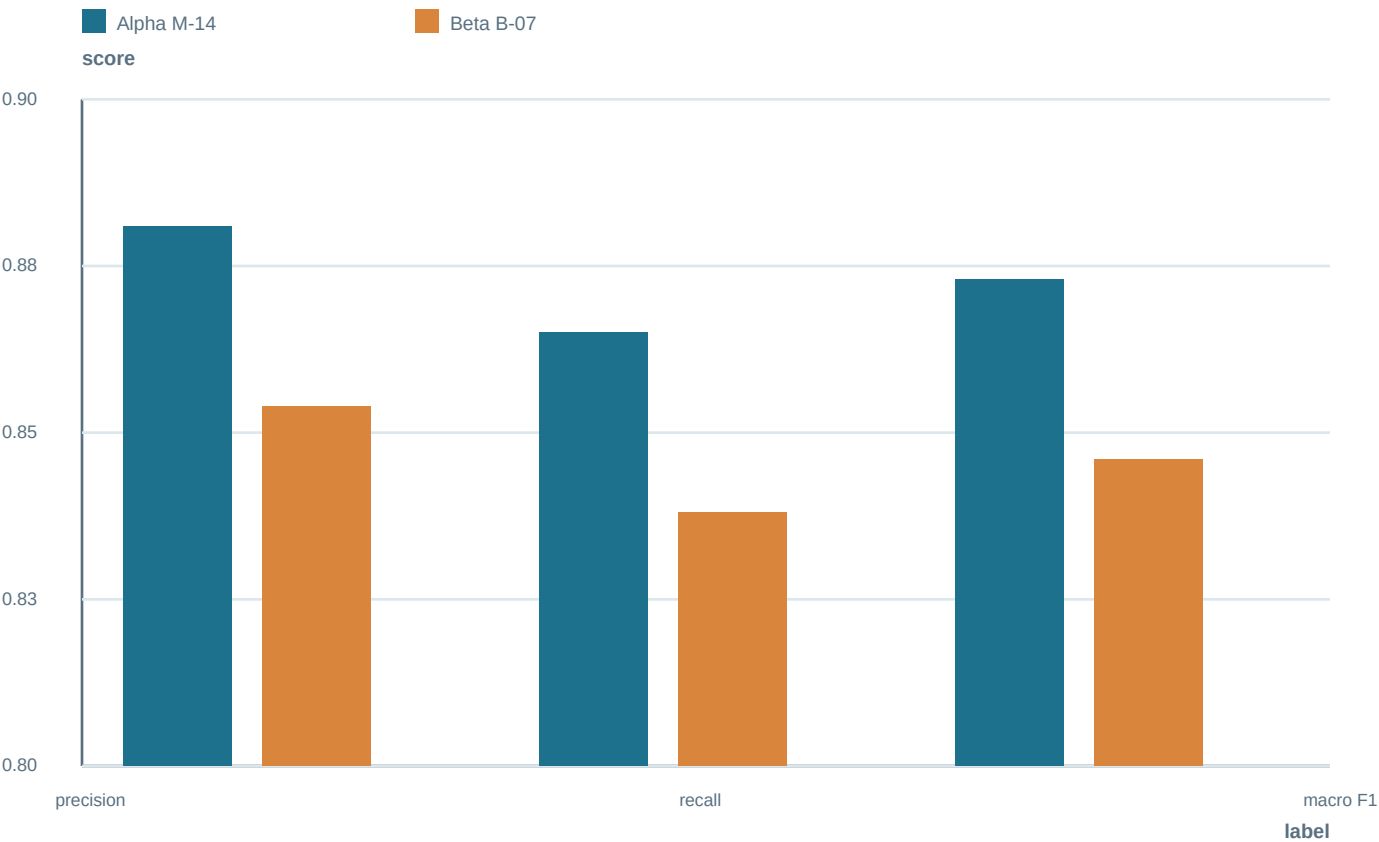

Alpha gains 0.027 macro F1; stronger recall matters because uncertain cases are routed rather than optimized for precision alone.

## Decision evidence

| model      | precision | recall | macro F1 |
|------------|-----------|--------|----------|
| Alpha M-14 | .881      | .865   | .873     |
| Beta B-07  | .854      | .838   | .846     |
| difference | +.027     | +.027  | +.027    |

# Candidate comparison

Topic-specific analytical figure for the same synthetic R184 record.

**Interpretation:**

Alpha improves the identical evaluator by 0.027 macro F1 over B-07.
