

Product metrics brief

Synthetic analytics snapshot · as-of 2026-07-13 · M-27 decision review 2026-09-18

Decision	Prioritize assisted setup experiments
Baseline adoption	18.4% (228 adopted / 1,240 eligible workspaces)
Q3 target	26.0% (323 adopted workspaces)
Gap	95 additional adopted workspaces
Primary definition	Adopted = setup complete plus first core workflow within 14 days of invitation

What the data says

June cohorts activate between 17.7% and 19.4% within 14 days. That narrow range indicates a repeatable setup constraint rather than an isolated cohort issue. D30 retention is 67.1% among activated workspaces, nearer its 70.0% target than adoption is to its target.

Measurement contract

Eligible workspaces exclude internal, test, and suspended workspaces. The 1,240 denominator is fixed for this as-of snapshot. Segment data marked unknown remains blank rather than being imputed. Daily active values are not summed because they are non-unique across dates; weekly active is a rolling seven-day unique count.

M-27 execution plan

Period	Action	Leading signal
Weeks 1–2	Instrument setup drop-off and validate invitation-to-activation timestamps.	Denominator and 14-day window reconcile.
Weeks 3–5	Test two assisted setup variants for eligible workspaces.	Cohort activation exceeds 20%.
Weeks 6–8	Scale the winning path; monitor core workflow usage.	WAU among adopters holds while activation grows.
M-27 · 2026-09-18	Review adoption, retention, and the decision to expand.	Progress toward 323 adopted workspaces.

Reconciliation notes

Activation cohorts reconcile exactly to 1,240 eligible workspaces and 228 adopted workspaces. Retention segments reconcile to 228 activated workspaces and 153 retained at day 30. Feature usage reports the same 228 adopted workspaces as a ceiling, with a 228 weekly-active observation on 2026-07-13.
