

Interview synthesis

Portfolio frame. 2026-07-13 | Decision milestone M-27: 2026-09-18 | Adoption reference: 18.4% baseline toward 26.0% across 1,240 synthetic workspaces.

Purpose and method

This synthesis combines three moderated synthetic written-note interviews: Participant A-01, A-02, and A-03. Notes were coded with the companion guide for explicit claims about onboarding, roles, alerts, exports, and repeat administration. Counts indicate coded mentions, not prevalence or causal effect.

What converged

Theme	Signal	Confidence
Time-to-first-value	A visible first routed outcome makes the product promise concrete.	High
Permissions comprehension	Role language without effective-capability context interrupts setup.	High
Admin automation	Reusable templates need a preview and clear publish authority.	High

"After I connected one team and saw its work queue, I understood the promise." - Participant A-01
"Every Monday I recreate the same routing rule for each new project." - Participant A-03

Decision frame for M-27

Decision 1: prioritize a guided first-value path. Add a concise checklist that leads from source connection to one visible routed item, supported by a sample workspace view. This responds to specific onboarding friction without committing to a long tutorial.

Decision 2: make roles and templates inspectable before action. At invitation and template-publish points, show effective capabilities, missing authority, and the inheritable settings preview. Keep the recommended role reversible.

Risks and limitations

The sample is three synthetic Alpha notes and is not representative of 1,240 workspaces. Timing statements are approximate self-reports. Export and alert themes appear in this set but are stronger comparative follow-up topics than Alpha implementation estimates. Do not attribute the adoption target change from 18.4% to 26.0% to these interviews.

Follow-up before milestone

Question	Observable check
Does the checklist shorten the path to a first routed item?	Track completion of the four steps in a synthetic usability scenario.
Do role explanations reduce stalled invites?	Ask users to predict permissions before confirming an invite.
Do template previews prevent incorrect reuse?	Observe whether administrators identify inherited owner and notification settings.
