

Interview synthesis

Portfolio frame. 2026-07-13 | Decision milestone M-27: 2026-09-18 | Adoption reference: 18.4% baseline toward 26.0% across 1,240 synthetic workspaces.

Comparative discovery readout

This synthesis uses two comparative synthetic written-note interviews: Participant B-01 and B-02. It is intended to sharpen hypotheses for Product Alpha Q3, not to define Product Beta requirements or quantify portfolio adoption.

Observed patterns

Theme	Signal	Confidence
Permissions comprehension	People hesitate when a role picker does not expose effective capabilities.	Medium
Export confidence	A downloaded file must declare scope, omissions, and generation context.	High
Admin automation	Schedules are trusted after a verified manual run and visible ownership.	Medium
Notification fatigue	Permission-change notices should be targeted and acknowledged, not repeated.	Medium

"I know who should edit work, but I do not know who can change the rules that affect everyone." - Participant B-01

"A download is not proof that I exported the right thing." - Participant B-02

Implications for Product Alpha Q3

- Decision 1: define an export-context contract.** Put workspace, filters, row count, generated time, and omitted-field/permission notices beside or inside every export. This supports a leadership handoff without revealing excluded data.
- Decision 2: sequence automation after verification.** Offer scheduled exports and reusable configuration only after a user can review a manual result, see the schedule owner and recipients, and cancel a pending delivery.

Method, limitations, and uncertainty

The sample has two comparative synthetic participants. Evidence is written-note based and is intentionally anonymous. It can reveal understandable failure modes but cannot estimate their rate, distinguish role-specific behavior across a population, or validate any adoption outcome. The Product Alpha Q3 reference remains 18.4% baseline toward 26.0% across 1,240 synthetic workspaces; no causal claim is made.

Recommended next check

Hypothesis	Test before or at M-27
Explicit role comparison reduces invite hesitation.	Ask participants to choose and explain a role using a reversible picker.
Context-rich exports reduce manual reconciliation.	Compare handoff confidence with and without filters, row count, and omission notice.
Schedule ownership makes automation safer.	Ask administrators to inspect, modify, and cancel a planned delivery.
