

Product Beta discovery synthesis

Juniper Works • 13 July 2026 • decision frame for the M-27 guided rollout gate

The decision in one sentence

Product Beta should test a guided bulk workflow only if its report makes the work explainable enough for an admin to share with confidence.

Evidence signal

Signal	What it means	Design response
1,240 synthetic workspaces	Repeatable weekly admin work	Reusable bulk rule
Alpha adoption: 18.4% to 26.0%	Portfolio context, not Beta proof	Evaluate Beta separately
Reports need proof	Totals alone are not trusted	Show source and history

Hypothesis

When an admin can choose scope, apply one bulk workflow, and review a report with visible provenance, Product Beta can earn weekly confidence without expanding the first release beyond its safety boundary.

Gate and next decision

M-27 is a guided rollout gate on 18 September 2026. The review should answer: Can scope be understood before action? Can a report be shared without manual reconciliation? Which failure states require a human handoff?

Scope boundary

This synthesis uses only synthetic Juniper Works planning material. It contains no customer records, personal data, or production telemetry.
