

Customer Success Health Check

Run a lightweight weekly health review for Customer Alpha and turn findings into owned actions.

Audience	Customer success leads and support partners
Prerequisites	Current account summary, ticket trend, and named success owner
Last reviewed	2026-08-04

Procedure

1. Review open volume, age, severity, and the count of unresolved tickets.
2. Separate the 17 unresolved tickets into blocked, waiting-on-customer, and active-investigation groups.
3. Check for repeat symptoms against KI-1042, KI-1047, KI-1051, and KI-1054.
4. Record one owner, next action, and checkpoint date for each at-risk item.
5. Share a concise health summary with the success owner and retain the internal action list.

Warnings

Warning: A health signal is directional, not a promise of churn or renewal outcome.

Warning: Do not include personal contact data in the shared summary.

Escalation boundary

Escalate when unresolved work is growing week over week, any 4-hour SLA is at risk, or a known issue affects a critical workflow.

Synthetic example

Example: Customer Alpha has 17 unresolved tickets: 6 active investigation, 7 waiting on evidence, and 4 blocked by a known-issue mitigation.

Internal operational guidance. Examples, names, IDs, and account details are synthetic.
