

Escalation Handoff Standard

Hand work to another team with enough context to act without restarting discovery.

Audience	Support leads, engineering liaisons, and incident coordinators
Prerequisites	Owned ticket, current customer impact, and gathered evidence
Last reviewed	2026-08-04

Procedure

1. State the customer impact in one sentence and identify the affected workflow.
2. List observed behavior, expected behavior, and exact reproduction steps.
3. Attach or link sanitized evidence and note which checks have already been completed.
4. Name the requested decision: workaround validation, defect triage, incident ownership, or data review.
5. Set the next customer update time and preserve support ownership until acceptance is confirmed.

Warnings

Warning: A handoff without an explicit requested decision causes avoidable delay.

Warning: Do not paste unredacted logs or account secrets into an escalation channel.

Escalation boundary

Escalate to the incident commander when impact broadens, customer data may be at risk, or no accepting team is identified within 30 minutes.

Synthetic example

Example: HD-3830 references KI-1051, includes sanitized job timing, requests export-worker triage, and sets a 16:00 JST customer update.

Internal operational guidance. Examples, names, IDs, and account details are synthetic.
