

HelioDesk Queue Routing Guide

Route new and reopened work by account tier, product area, and urgency without duplicating ownership.

Audience	Support specialists and queue managers
Prerequisites	Queue access and the current assignment view
Last reviewed	2026-08-04

Procedure

1. Open Queue > Unassigned and filter for new activity in the last 30 minutes.
2. Confirm requester account and product area from the ticket header; do not infer from the subject line.
3. Apply the routing tag: Core, Admin, Data Export, or Integrations.
4. Assign Customer Alpha tickets to the named success pod and leave a short internal routing note.
5. For each of the 17 unresolved tickets, verify that one owner and one next action are recorded.

Warnings

Warning: Do not move a ticket only to improve queue metrics.

Warning: Do not disclose account context in public replies.

Escalation boundary

A ticket with a safety, data-loss, or production-access impact bypasses normal routing and goes directly to the on-call escalation lead.

Synthetic example

Example: HD-3817 is tagged Data Export, assigned to the Customer Alpha pod, and noted as "Owner confirms export scope by 14:00 JST."

Internal operational guidance. Examples, names, IDs, and account details are synthetic.
