

Known-Issue Troubleshooting

Use approved mitigations for known issues while keeping customer-facing guidance precise.

Audience	Frontline support specialists
Prerequisites	Ticket reproduction details, browser/app version, and account tier
Last reviewed	2026-08-04

Procedure

1. Search the known-issue register by symptom and product area before drafting a workaround.
2. Confirm the issue ID, affected versions, and mitigation preconditions.
3. Run the documented check in a synthetic test context or request the minimum customer evidence.
4. Share the approved workaround and state its limits plainly.
5. Link the ticket to the known issue and schedule a follow-up when the issue status changes.

Warnings

Warning: Do not label an issue "known" based on similarity alone.

Warning: Do not copy internal diagnostic notes into a customer reply.

Escalation boundary

Escalate when the symptom differs from the documented scope, the workaround fails, or evidence suggests data exposure.

Synthetic example

Examples: KI-1042 covers delayed notification badges; KI-1047 covers stale dashboard filters; KI-1051 covers export job stalls; KI-1054 covers attachment preview timeouts.

Internal operational guidance. Examples, names, IDs, and account details are synthetic.
