

AC-27 Vulnerability Register Vulnerability Register Remediation Assurance Report

Artifact ID	p03-full-006270
Artifact review period	2026-07-13
Direct dependency record period	2026-07-13
Direct dependency	2026-07-13-vulnerability-register-remediation-evidence-metrics-csv-s002806.csv

Review purpose and boundary

This synthetic assurance review evaluates the direct-source vulnerability register remediation record for Cobalt Harbor Systems under Aegis Control AC-27. The artifact is assigned to 2026-07-13; its direct source record is separately dated 2026-07-13. The record contains 1 structured row(s), and is treated as bounded evidence rather than a live system export.

Direct dependency facts

Field	Recorded value
artifact id	p03-full-002806
source id	p03-src-002806
ledger path	security/vulnerabilities/foundation/data/2026-07-13-vulnerability-register-remediation-evidence-metrics-csv-s002806.csv
record period	2026-07-13
register topic	vulnerability register remediation
disposition context	remediation records ACT-260713-011 reviewer-completion register validation and follow-up disposition
positive spine refs	org.cobalt-harbor = Cobalt Harbor Systems is a fictional managed logistics and harbor-operations platform organization. exception.exc-260713-006 = EXC-260713-006 records one synthetic delayed reviewer attestation; compensating review completes on 2026-07-14. date.2026-07-13 = 2026-07-13 is the primary review date; AC-27 review closes at 16:45 UTC.
organization	Cobalt Harbor Systems
control	AC-27
review date	2026-07-13
evidence set	184
case id	CASE-260713-184
risk id	RISK-031
residual rating	Medium
exception id	EXC-260713-006
action id	ACT-260713-011
reviewed records	48
timely attestations	47
final completion rate	100.0%
status	closed_with_follow_up

Assessment question

Assessment question: does the direct-source vulnerability register remediation record support a bounded AC-27 lineage checkpoint / package boundary checkpoint / package-to-retention route?

Test method: compare each populated source field to the readable register; then limit package inclusion to synthetic evidence through the package-to-retention route.

Analytic rationale: A lineage review asks whether each conclusion can be walked back to one populated row field. Evidence procedure: The package decision stays inside the documented synthetic evidence boundary. This artifact uses the package-to-retention route to keep its decision bounded. Procedural safeguard: Separate a package-retention recommendation from any claim about a production environment. Ordered procedure: start from the source status, review the disposition context, and use the completion metric only as supporting data. Counterexample: a favorable percentage cannot substitute for a source status. Decision rule: the status field governs whether the artifact is retained for the next review.

Finding: the source identifies vulnerability register remediation and states remediation records ACT-260713-011 reviewer-completion register validation and follow-up disposition. It records 48 reviewed records, 47 timely attestations, final completion of 100.0%, and status closed_with_follow_up. These values are retained as recorded evidence, not inferred operational results.

Decision and follow-up: retain this synthetic derivative for the next GRC evidence-chain check because the stated lineage checkpoint / package boundary checkpoint / package-to-retention route is documented. Re-evaluate against the same direct record before any later retention or closure decision; do not generalize this review to a live environment. Ordered procedure: start from the source status, review the disposition context, and use the completion metric only as supporting data. Counterexample: a favorable percentage cannot substitute for a source status. Decision rule: the status field governs whether the artifact is retained for the next review.

Boundary: this report establishes no Kio indexing, search, history, chunk, or performance claim.
