

AC-27 Vulnerability Register Vulnerability Register Remediation Assurance Report

Artifact ID	p03-full-000970
Artifact review period	2026-07-20
Direct dependency record period	2026-07-20
Direct dependency	2026-07-20-vulnerability-register-remediation-evidence-metrics-csv-s003278.csv

Review purpose and boundary

This synthetic assurance review evaluates the direct-source vulnerability register remediation record for Cobalt Harbor Systems under Aegis Control AC-27. The artifact is assigned to 2026-07-20; its direct source record is separately dated 2026-07-20. The record contains 1 structured row(s), and is treated as bounded evidence rather than a live system export.

Direct dependency facts

Field	Recorded value
artifact id	p03-full-003278
source id	p03-src-003278
ledger path	security/vulnerabilities/foundation/data/2026-07-20-vulnerability-register-remediation-evidence-metrics-csv-s003278.csv
record period	2026-07-20
register topic	vulnerability register remediation
disposition context	remediation records ACT-260713-011 reviewer-completion register validation and follow-up disposition
positive spine refs	org.cobalt-harbor = Cobalt Harbor Systems is a fictional managed logistics and harbor-operations platform organization. action.act-260713-011 = ACT-260713-011 publishes the AC-27 reviewer-completion register; completed 2026-07-15. date.2026-07-20 = 2026-07-20 is the seven-day follow-up for closure evidence and residual-risk status.
organization	Cobalt Harbor Systems
control	AC-27
review date	2026-07-13
evidence set	184
case id	CASE-260713-184
risk id	RISK-031
residual rating	Medium
exception id	EXC-260713-006
action id	ACT-260713-011
reviewed records	48
timely attestations	47
final completion rate	100.0%
status	closed_with_follow_up

Assessment question

Assessment question: does the direct-source vulnerability register remediation record support a bounded AC-27 chronology checkpoint / closure checkpoint / status-to-closure route?

Test method: trace the recorded exception through its disposition context; then test closure wording only against the status field through the status-to-closure route.

Analytic rationale: A chronology review reads exception language in sequence and does not invent intervening events. Evidence procedure: The review checks the disposition phrase against the status value instead of inventing a control result. This artifact uses the status-to-closure route to keep its decision bounded. Procedural safeguard: Require a status value and its contextual explanation before using closure language. Evidence slice: use the reviewed-record count and timely-attestation observation as the primary gate; treat closure wording only as a later record label. Ordered procedure: (1) verify the population count is present, (2) compare the timely observation to that population without calculating a replacement rate, (3) inspect the completion value as a distinct later milestone, and (4) record status last. Counterexample: a closure-oriented context with missing population evidence is not suitable for a remediation conclusion. Safeguard: route an incomplete count relationship to the synthetic GRC evidence custodian before any package decision. Finding severity: classify a missing population linkage as a documentation-quality limitation, not a control failure. Decision rule and timing: retain only the count-qualified observation now; defer any closure interpretation until the next reviewer obtains the same complete source row.

Finding: the source identifies vulnerability register remediation and states remediation records ACT-260713-011 reviewer-completion register validation and follow-up disposition. It records 48 reviewed records, 47 timely attestations, final completion of 100.0%, and status closed_with_follow_up. These values are retained as recorded evidence, not inferred operational results.

Decision and follow-up: retain this synthetic derivative for the next GRC evidence-chain check because the stated chronology checkpoint / closure checkpoint / status-to-closure route is documented. Re-evaluate against the same direct record before any later retention or closure decision; do not generalize this review to a live environment. Evidence slice: use the reviewed-record count and timely-attestation observation as the primary gate; treat closure wording only as a later record label. Ordered procedure: (1) verify the population count is present, (2) compare the timely observation to that population without calculating a replacement rate, (3) inspect the completion value as a distinct later milestone, and (4) record status last. Counterexample: a closure-oriented context with missing population evidence is not suitable for a remediation conclusion. Safeguard: route an incomplete count relationship to the synthetic GRC evidence custodian before any package decision. Finding severity: classify a missing population linkage as a documentation-quality limitation, not a control failure. Decision rule and timing: retain only the count-qualified observation now; defer any closure interpretation until the next reviewer obtains the same complete source row.

Boundary: this report establishes no Kio indexing, search, history, chunk, or performance claim.
