

AC-27 Vulnerability Register Vulnerability Register Closure Evidence Assurance Report

Artifact ID	p03-full-001043
Artifact review period	2026-q3
Direct dependency record period	2026-q3
Direct dependency	2026-q3-vulnerability-register-closure-evidence-evidence-metrics-tsv-s003319.tsv

Review purpose and boundary

This synthetic assurance review evaluates the direct-source vulnerability register closure evidence record for Cobalt Harbor Systems under Aegis Control AC-27. The artifact is assigned to 2026-q3; its direct source record is separately dated 2026-q3. The record contains 1 structured row(s), and is treated as bounded evidence rather than a live system export.

Direct dependency facts

Field	Recorded value
artifact id	p03-full-003319
source id	p03-src-003319
ledger path	security/vulnerabilities/foundation/data/2026-q3-vulnerability-register-closure-evidence-evidence-metrics-tsv-s003319.tsv
record period	2026-q3
register topic	vulnerability register closure evidence
disposition context	closure evidence records evidence-set 184 reconciliation and the bounded closure disposition
positive spine refs	org.cobalt-harbor = Cobalt Harbor Systems is a fictional managed logistics and harbor-operations platform organization. exception.exc-260713-006 = EXC-260713-006 records one synthetic delayed reviewer attestation; compensating review completes on 2026-07-14. period.2026-q3 = 2026-Q3 is the governance planning period from 2026-07-01 through 2026-09-30.
organization	Cobalt Harbor Systems
control	AC-27
review date	2026-07-13
evidence set	184
case id	CASE-260713-184
risk id	RISK-031
residual rating	Medium
exception id	EXC-260713-006
action id	ACT-260713-011
reviewed records	48
timely attestations	47
final completion rate	100.0%
status	closed_with_follow_up

Assessment question

Assessment question: does the direct-source vulnerability register closure evidence record support a bounded AC-27 package boundary checkpoint / package boundary checkpoint / package-to-retention route?

Test method: limit package inclusion to synthetic evidence; then limit package inclusion to synthetic evidence through the package-to-retention route.

Analytic rationale: A package-boundary review tests whether the artifact remains limited to the synthetic evidence set. Evidence procedure: The package decision stays inside the documented synthetic evidence boundary. This artifact uses the package-to-retention route to keep its decision bounded. Procedural safeguard: Separate a package-retention recommendation from any claim about a production environment. Evidence slice: inspect the source topic, the direct record period, and the disposition context as a three-part retention packet. Counterexample: matching period text with a mismatched topic would invalidate a topic-specific report. Decision rule: retain only when all three fields describe the same register record.

Finding: the source identifies vulnerability register closure evidence and states closure evidence records evidence-set 184 reconciliation and the bounded closure disposition. It records 48 reviewed records, 47 timely attestations, final completion of 100.0%, and status closed_with_follow_up. These values are retained as recorded evidence, not inferred operational results.

Decision and follow-up: retain this synthetic derivative for the next GRC evidence-chain check because the stated package boundary checkpoint / package boundary checkpoint / package-to-retention route is documented. Re-evaluate against the same direct record before any later retention or closure decision; do not generalize this review to a live environment. Evidence slice: inspect the source topic, the direct record period, and the disposition context as a three-part retention packet. Counterexample: matching period text with a mismatched topic would invalidate a topic-specific report. Decision rule: retain only when all three fields describe the same register record.

Boundary: this report establishes no Kio indexing, search, history, chunk, or performance claim.
