

# Study Alpha findings summary

Executive synthesis for product, design, and operations

## READOUT

Study Alpha is a fully synthetic Beacon Field Research exercise. Across n=24 synthetic participant records, observed task behavior clustered around navigation and status visibility, trust in confirmations, error recovery, and accessible wayfinding.

### Observed pattern counts

|                                        |         |
|----------------------------------------|---------|
| Navigation or status hesitation        | 17 / 24 |
| Reassurance seeking after confirmation | 14 / 24 |
| Recoverable error moment               | 9 / 24  |
| Need for stronger wayfinding cue       | 8 / 24  |

## INTERPRETATION

The evidence is directional. Counts describe observed behaviors in this synthetic study and do not establish causality, predict outcomes, or support population-level inference.

## RECOMMENDED ACTION

Prototype a connected confidence layer: persistent status, specific confirmation detail, and a named recovery route. In a subsequent observation round, separately assess unprompted status recall, confirmation interpretation, and recovery success.

# Evidence boundaries & next steps

How to use this artifact responsibly

---

## WHAT THESE FINDINGS SUPPORT

The artifacts support prioritizing a prototype conversation and defining observable checks. They support a focus on handoffs rather than a claim that any single screen caused friction.

## WHAT THEY DO NOT SUPPORT

They do not identify real people, contain real quotes, use external sources, demonstrate statistical significance, or claim accessibility conformance. Participant codes S01-S24 are synthetic references only.

## PROTOTYPE REVIEW QUESTIONS

Can a participant state their current status? Does confirmation make the change and next action explicit? Is recovery presented as a named, legible route? Are location and state understandable without relying on color or position alone?
