

Study Beta Analysis Plan

Beacon Field Research | Study Beta | July 2026 | Synthetic planning reference

Evidence model

Each evidence note includes session ID, participant code, task, prototype state, observable behavior, outcome, confidence rating, and tags. Observations are distinct from analyst hypotheses.

Coding

Use workflow tags: capture, save-state, attach, review, handoff, recovery. Use access tags when relevant: keyboard, magnification, captions, bandwidth. Outcomes are complete, recovery, blocked, or interrupted.

Synthesis

Observers independently tag notes before the Jul 24 synthesis. The team clusters by task and preserves counterexamples. Severity is critical, major, moderate, or minor based on core-task impact, recurrence, and access equivalence.

Decision rules

Frequency is directional, not a population estimate. A finding needs observable behavior plus explanation or a clearly labeled inference. Interrupted tasks are not scored as failures. Report n=8 formative evidence and avoid comparative performance claims.
