

Product Alpha R7 API Review

Release readiness review | 2026-07-13 | Aster Loop K.K.

Disposition: approve the contract baseline for the ADR-042 asynchronous release gate, subject to the compatibility controls on page 2.

Executive summary

The R7 API exposes a replay-safe release creation operation, a stable status read, and cursor-based collection navigation. The create path targets p95 184 ms excluding asynchronous release execution. Every request is correlated with X-Request-Id and safe error envelopes.

Area	Review result	Evidence
Async control	Approved	ADR-042 prevents execution until approval
Reliability	Measured contract target	p95 184 ms for create/status boundary
Consumer safety	Approved	Idempotency, opaque cursors, structured errors
Release window	Noted	09:00-12:00 JST on 2026-07-13

Interface disposition

POST /v1/releases requires Idempotency-Key. A valid R7 request returns 202 while the gate is awaiting approval; status progresses requested → awaiting_approval → approved → running → completed. GET /v1/releases/{releaseId} returns the current gate state. List ordering is createdAt then releaseId, with opaque exclusive cursors.

Compatibility and risks

Compatibility review

R7 is additive within /v1. Clients must ignore unknown object fields. The compatibility diff blocks endpoint removal, newly required request fields, and enum narrowing. Any such change requires /v2. Deprecated fields carry Deprecation and Sunset headers for at least two release windows.

Risk	Control	Disposition
Duplicate create	Same idempotency key replays original result; changed body is 409	Accepted
Approval bypass	ADR-042 is recorded on every release object and event	Accepted
Timeout ambiguity	504 is retryable only with the same idempotency key	Accepted
Event duplication	Consumers deduplicate eventId; releaseId is the correlation key	Accepted
Unsafe diagnostics	Error catalog messages are user-safe and include requestId	Accepted

Final disposition

Approve Product Alpha R7 API contract publication for the stated release window. Before deployment, run the contract tests, schema compatibility check, OpenAPI and AsyncAPI parsing, and the Spectral policy. Operational owners should retain the generated request IDs for post-release correlation; no customer or credential data is present in this review.

Review scope

This text-layer document reviews the synthetic API artifacts only. It does not attest to production deployment, indexing, history replay, search behavior, or measured production latency.
