

Product Beta API Design Review

Preview design | 2026-07-13 | Aster Loop K.K.

Recommendation: publish the bounded preview alongside Product Alpha R7, retain ADR-042 as the approval gate, and defer graduation until compatibility evidence is reviewed.

Difference from Alpha R7

Beta preserves request correlation, opaque identifiers, stable pagination, safe errors, and the p95 184 ms contract target. It introduces betaReleaseId, a cancellable request before approval, and webhook delivery envelopes. Alpha R7 remains the non-preview baseline.

Aspect	Product Alpha R7	Product Beta preview
Identifier	releaseId	betaReleaseId
Gate	ADR-042 approval	ADR-042; cancel before approval
Stability	/v1 contract	Bounded /v1/beta preview
Events	Release lifecycle	Envelope with delivery attempt

Risks and next decisions

Risk register

Risk	Control	Decision
Preview drift	Schema diff blocks removals, required additions, and enum narrowing	Review before graduation
Duplicate delivery	eventId deduplication and delivery attempt	Require acknowledgement
Late cancellation	Reject after ADR-042 approval	Keep rule explicit
Timeout ambiguity	504 is retryable using same request identity	Keep retry example

Next decisions

Decide whether betaReleaseId graduates into a stable resource name, define the exact cancellation audit record, and set a consumer notice period. The release window is 09:00-12:00 JST on 2026-07-13. This text-layer review is synthetic and does not attest to production deployment, production latency, indexing, or search behavior.
