

INTERNAL INCIDENT NOTE

SYNTHETIC REHEARSAL

Organization: Aster Loop 株式会社

Product / Service: Product Alpha R7

Date (YYYY-MM-DD): 2026-07-13

Incident ID: ADR-042

Severity: ☐ Sev 1 ☒ Sev 2 ☐ Sev 3 ☐ Sev 4

Author: Platform Reliability Team

Status: Closed - Rehearsal

Incident: delayed terminal decision

Summary:

During rehearsal traffic, a portion of requests experienced increased latency in terminal decision. Impact limited to internal testing.
No production impact.

Impact:

- p95 latency: p95 184 ms
- Error rate: 0%
- Affected scope: internal rehearsal traffic
- User impact: none

Detection:

- Alert: Latency p95 > 150 ms.
- Detected at: 10:12 JST
- Detected by: Monitoring (Grafana)

Timeline (JST):

- 10:12 Alert triggered (p95 > 150 ms)
- 10:14 Investigation started
- 10:18 Identified worker failure on shard 3
- 10:21 Worker restarted
- 10:24 Traffic recovering
- 10:28 p95 back to baseline
- 10:35 Incident closed

Root Cause (rehearsal only):

Worker process crashed due to unhandled exception in decision module.
Checkpoint persisted; no state loss.

Mitigation / Remediation:

Mitigation: restore worker and retain checkpoint

- ☒ Restarted worker on shard 3
- ☒ Verified checkpoints intact
- ☒ Monitored until metrics normalized

Follow-ups / Actions:

- ☒ Add guard for unexpected null terminal result
- ☒ Improve alert threshold runbook
- ☒ Add unit test for decision module edge case
- ☐ Future: autoscale workers on sustained queue depth

Notes:

No customer data

This was a synthetic rehearsal.
No customer data was processed, stored, or accessed.
