

Review 842 approval summary

Aster Loop Co., Ltd. | Product Alpha R7 | release 2026-07-13 | ADR-042

Decision

Approved for controlled promotion after the listed evidence is attached to the release timeline. This record describes synthetic review evidence only; it contains no customer, credential, or production account data.

Reviewed change

The release gate now accepts a request, records a pending state, and exposes a terminal decision to compatible polling clients. ADR-042 is the governing decision for this asynchronous behavior. A stale append is rejected by expected-version comparison, and cancellation remains an explicit error path.

Evidence	Observed result
Synthetic canary gate completion	p95 184 ms
R6-compatible status polling	Terminal states exercised
Router cancellation branch	Explicit error and regression test
Append conflict	Optimistic version check

Approval conditions and checks

Conditions

1. The R6 client must poll a `gate_id` until a terminal accepted or rejected state is observed. 2. Terminal decisions must carry `decision_ref` ADR-042. 3. The terminal-only percentile query must stay at or below 200 ms; the reviewed synthetic sample is 184 ms. 4. A rollback must pause promotion and preserve append-only decision evidence.

Check excerpts

```
if request.cancelled { return Err(GuardError::Cancelled); }  
if actual != expected { return Err(StoreError::Conflict { expected, actual }); }
```

Review resolution

The cancellation branch, stale-version protection, schema guard, and latency filter were all marked resolved. Unknown additive payload fields remain tolerated to preserve Product Alpha R7 coexistence, while missing terminal decision references are rejected.

Residual risks and release evidence

Residual risks

The p95 figure is a repeatable synthetic canary observation, not a service-level objective. A delayed worker can leave a gate pending during a rollout; the operator response is to retain the gate record, restore worker capacity, and verify terminal status before resuming promotion. Storage selection remains outside ADR-042.

Evidence retention

Retain the reviewed patch metadata, terminal-only query result, synthetic sample counts, `gate_id` timeline reference, and rollback verification result. Do not retain personal reviewer identities or customer payloads in this artifact.

Disposition

Approved after deterministic checks. Product Alpha R7 | 2026-07-13 | ADR-042 | p95 184 ms.
