

ADR-042 Evidence Pack

Decision packet | 2026-07-13 | Aster Loop K.K. | release 2026-07-13

Decision question

Can Product Alpha R7 retain a p95 184 ms control-plane objective while preserving an auditable approval boundary?

Measurement method

Synthetic staging fixtures send 100 deterministic create and status requests per operation. Timers run from receive to response; asynchronous worker execution is excluded.

Evidence	Observation	Decision use
Control plane	p95 target 184 ms	Budget acceptance
Approval	Explicit event transition	Auditable gate
Correlation	Request ID + release ID	Failure diagnosis
Window	09:00-12:00 JST	Bounded rollout

Latency evidence

The working budget reserves p95 184 ms. Request IDs are retained with the fixture result so the decision packet can connect API and event observations.

Failure scenarios

Approval service unavailable: keep state awaiting approval and return a safe retryable failure. Duplicate create: reuse idempotency result. Worker failure: record failed without erasing the approval trail.

Alternatives

Synchronous approval risks a latency breach; implicit worker approval hides responsibility; a manual release path loses uniform status. ADR-042 retains explicit state plus asynchronous execution.
