

ADR-042 Risk Review

Decision packet | 2026-07-13 | Aster Loop K.K. | release 2026-07-13

Risk posture

ADR-042 reduces unauthorized execution risk while introducing dependency on an approval transition and event delivery.

Assessment method

Likelihood and impact use low, medium, high labels for synthetic release control scenarios. The control-plane p95 target remains 184 ms.

Scenario	Likelihood / impact	Mitigation
Duplicate request	Medium / medium	Idempotency key and request ID
Approval delay	Medium / high	Visible awaiting state, owner escalation
Worker failure	Low / high	Failed state and retry procedure
Event duplicate	Medium / low	eventId deduplication

Residual risk

A delayed approval can extend release duration. It does not permit execution without approval; the residual risk is accepted for the 2026-07-13 release window.

Mitigations

Use idempotency, request IDs, event deduplication, p95 monitoring against 184 ms, and an explicit rollback to awaiting approval if a worker cannot start.

Review outcome

Accept with Platform Release Owner monitoring and a post-window review of latency and delivery observations.
